Docket No. K-0634

Serial No. 10/824,363

Amdt. dated August 4, 2006

Reply to Office Action of May 8, 2006

Listing of Claims

1. (Original) An organic electroluminescence display panel formed of a glass

substrate including an indium-tin-oxide strip, a counter electrode, an organic electroluminous

layer, and a cathode strip, adhered to a seal-cover by using a sealant, wherein the counter

electrode is formed in a grid form at a crossing point between the counter electrode and the

sealant.

2. (Currently Amended) The display panel according to claim 1, wherein the counter

electrode is formed in one of or a combination of at least two of a polygon, a cross, or and a

circle.

3. (Original) The display panel according to claim 1, wherein the counter electrode is

formed of a metal, such as molybdenum (Mo) and chrome (Cr).

4. (Original) The display panel according to claim 1, wherein the insulating layer is

expanded to a predetermined area, including the crossing point between the counter electrode

and the sealant, and to an area of the glass substrate, so as to be formed on a periphery of the

organic electroluminous layer.

4

Serial No. 10/824,363 Amdt. dated August 4, 2006 Reply to Office Action of May 8, 2006

- 5. (Original) The display panel according to claim 3, wherein the cathode strip is formed of a conductive material, such as a magnesium (Mg)-silver (Ag) alloy and aluminum (Al).
- 6. (Currently Amended) A method for fabricating an organic electroluminescence display panel, comprising:

forming an indium-tin-oxide strip on being a transparent electrode, so as to apply an anode onto a glass substrate;

forming a counter strip on the indium-tin-oxide strip located in regions other than an emitting region, wherein the counter strip is electrode in a grid form having a plurality of holes, so as to have a width smaller than that of the indium-tin-oxide strip;

forming a first insulating layer <u>on the glass substrate having the indium-tin-oxide</u>

<u>strip; and</u>

forming a barrier rib on the insulating layer;

serially forming an electroluminous (EL) layer and a cathode strip in the emitting region; and

adhering a seal-cover to the glass substrate by using a sealant.

Docket No. K-0634

Serial No. 10/824,363 Amdt. dated August 4, 2006 Reply to Office Action of May 8, 2006

- 7. (Currently Amended) The method according to claim 6, wherein the <u>indium-tin-oxide strip includes forming</u> a first indium-tin-oxide strip <u>and includes simultaneously forming</u> a second indium-tin-oxide strip, <u>the second indium-tin-oxide strip</u> having a width smaller than that of the first indium-tin-oxide <u>strip</u>, <u>between each barrier rib</u>.
- 8. (Currently Amended) The method according to claim 6, wherein the <u>plurality of holes includes forming a counter electrode in a grid form includes forming the counter electrode</u> in one of or a combination of at least two <u>shapes</u> of a polygon, a cross, <u>or and</u> a circle.
- 9. (Original) The method according to claim 6, wherein the forming a first insulating layer and a barrier rib includes expanding the insulating layer a predetermined area, including the crossing point between the counter electrode and the sealant, and to an area of the glass substrate, so as to be formed on a periphery of the organic electroluminous layer.
